## Administration Problems Bared

By E. Drake Lundell Jr.  
and Thomas J. Morton  
or the CW staff

HOUSTON—In the face of a dropping economy, the Data Processing Management Association's 20th international data processing conference and business exposition last week showed about the same attendance as last year, even though the number of exhibitors declined. But pent-up frustration and disenchantment with the administrative staff of DPMA surfaced at the international board of directors' meeting just before the official opening.

Although some of the disenchantment remained, many of the international directors indicated that steps taken at the meeting would significantly alleviate the grievances if they are carried out successfully.

According to reports from the meeting, international directors of the organization showed particular concern with problems of the international area, member relations, and the overall efficiency and effectiveness of the administrative staff.

A reported attempt from the floor to call for the resignation of Executive Director R. Calvin Elliott was headed off when outgoing President James D. Parker Jr. agreed to have read to the international directors a previously unavailable analysis of

the administrative operation and organization of the association.

The study was commissioned last year and performed by Touche, Ross and Co. The report, according to an attendee at the meeting, revealed that operations at the headquarters, while businesslike, were getting more and more out of control, because no decisions had ever been made on what the functions of headquarters were. This was believed to be degrading relations

ships between members and headquarters.

President Parker was asked to establish a committee to implement the study which called, in part, for more decision-making power for the executive director in day-to-day operations.

#### Member Relations

In the area of member relations, the meeting of the international board of directors (Continued on Page 3)

## Nader Asks Community to Help Consumers

By Alan Drattell

CW Washington Bureau

WASHINGTON, D.C. — Ralph Nader called on the computer community last week to use its technology to help the consumer movement.

"Computerized systems can help redress the imbalance which keeps growing between seller and buyer," he said, adding that the computer community can do a number of things "to further the objectives of servicing the consumer."

The remarks occurred at a discussion of a proposed consumer information system, now being worked on voluntarily by a number of computer professionals under the aegis of Nader's public interest research group.

"The quest [for such a system] will test the professional commitment of those in the computer community to develop more balanced uses of computers for returning power to the consumer," Nader said.

There are four steps the computer community can take to reach and help the consumer, Nader said.

- Develop a technical universe that would include anticipating the bugs "which will inevitably

arise in the first stages" of a consumer system based on EDP technology.

- Inform the consumer as to what a computer-based system can do for him.

- Acknowledge that "vested interests" will oppose the application of computerized systems, since they will not welcome the consumers' abilities to find out product differences in very un-

derstandable terms.

- The computer community must indulge in "a little old-fashioned lobbying for public interest." Nader asked why the computer community shouldn't, for example, begin interesting Congress in holding hearings.

Nader admitted that the application of computers to consumer information systems is a

relatively unexplored field.

T.D.C. Kuch, a senior systems analyst at the National Institutes of Health and one of the computer professional volunteers involved in the development of a consumer information system outlined some concepts of such a system.

In the final analysis, he said, the question, "What do the consumers want?"

## IBM Reconfigures Maintenance Rates

By Michael Merritt

CW Staff Writer

WHITE PLAINS, N.Y. — IBM has rearranged some of its maintenance prices and services, and for the most part, increased prices at its Datacenters.

The extra-hours maintenance premium has drifted down, per-call hourly maintenance rates have floated up, and a new service is being given telephoning users at no extra charge.

Minimum monthly maintenance rates were left unchanged by the latest announcement.

IBM recently reduced maintenance rates on 2300s, 5211s, 3330s, and 3440s and their controllers. Shift differentials were eliminated for equipment on fixed term leases.

The per-call increases raised hourly rates on key-entry and terminal equipment from \$22 to \$24, on System/3 and 7, 360/20, 1130, 1800, unit record and EAM equipment from \$22 to \$24, and on the rest of 360, 570, 1400, and 7000 series equipment from \$26 to \$32.

On purchased equipment, the minimum monthly maintenance charge gives users nine hours a day, five days a week, of maintenance availability.

Users who consistently run more than nine hours a day, though, may want to increase their coverage. The extra cost for this is figured as a percentage of the minimum charge.

For example, 24 hour service on electronic equipment — 360 CPUs, displays, and so on, used to cost 30% more than the standard nine hours.

At the new rates it costs only 26% more.

For 12 hours of coverage, the premium has declined from 15% to 14%.

On electro-mechanical equipment — printers, disks, and the like, the 24-hour premium has fallen from 45% to 34%, and the 12-hour rate from 18% to 16%.

The 24-hour rate on strictly mechanical equipment has been lowered from 60% to 46%, and the 12-hour rate from 20% to 19%.

### Heart Throbs

MOUNTAIN VIEW, Calif. — Doctors can watch an animated computer display of a patient's diseased heart as it beats, using a system devised by a New-Stanford University medical team. Shown here as a left ventricle in three stages of contraction, the images permit the doctors to figuratively "walk around" the isolated beating heart to determine the need for surgery. The images may also be stopped at any point of expansion or contraction and played back. Using an IBM 1800, a three-dimensional image of any desired heart chamber may be projected on a 2500 screen. The system's animated display is exact enough to show a dead section of the heart wall about the size of a nickel, details of large malfunctions and holes between heart chambers.

# Computer No Savior, Should Be Treated as Team Member: Jones

By Thomas J. Morton

CW staff writer

**HOUSTON**—The computer should not be regarded as the savior of American corporate existence, but rather a mere member of the team in the corporate operation, said the keynote speaker at the 20th DPMA conference.

John L. Jones, vice-president of Management Information Services for Southern Railway Systems, believes "the computer should make money for the corporation, not just save it."

Jones, a holder of a master's degree in electrical engineering and mathematics from MIT, defined the major problem facing DP as a serious communications gap between the computer operation staff of a corporation and management.

The gap has to be bridged, he said, for the benefit of American business and for the sake of this industry.

Jones, vice-president in charge of Management Systems and Sciences Division of the American

Management Association, said top management may say it is vitally interested in bridging the existing communications gap but not mean it because it does not see the gap exists or that it should communicate with DP at all.

The wall between the two factions, he said, is not built entirely by management. "DP people have a way," he said, "of turning people off. They seem to be more interested in doing their own work at odd hours and talking their own language among themselves than in really becoming members of the total corporation."

Management is becoming increasingly aware of the value of the computer, Jones noted. "It is almost inconceivable," he continued, "that in modern business, top management will allow a goodly percentage of its corporate resources—up to and including millions of dollars—to be spent without having the slightest idea why it is being spent. That era is, fortunately,

behind us."

"DP," he said, "must take the initiative to become part of the management resource team, to make sure that management becomes involved in the DP operation."

"And then the DP people must be able to communicate in straightforward, basic language, and be sure that management does understand, and not be satisfied with a verbal nod."

It is the responsibility of top management, Jones explained, to determine what is to be accomplished by systems. It is the responsibility of DP to determine how the what is to be accomplished. Both have the responsibility of being sure that the other understands completely.

This, he said, can be accomplished by a "committee" approach to corporate DP: a committee comprised of both top management and DP management whose function it is to develop applications in computer usage.

## Seminars Present Varied Topics, Interest High

**HOUSTON**—A new format, a stress on management techniques, and a complete departure from the norm was the 1971 version of the seminar program of the DPMA conference.

Most crowded of all the seminars was Cndr. Grog Hoppper's "Managing the Computer."

She told her audience she is appalled to enter centers now and see up to 30% of the CPU's capacity being devoted to the operating system. "What a waste," she said. "I dread the day when I will go into a center and find the processor doing 100% on operating."

She said she couldn't understand how companies that delete authority to distinct functions within the corporate structures make themselves subservient to one DP operation.

"Within five to 10 years," she said, "we'll have the equipment we need to make MIS on-line in minis with a mini data base. Minis talking to minis and giving people just the information they want."

"When a sales manager wants the reports on his salesmen, he doesn't want their social security numbers and health records too. Mini data bases and minicomputers can make data processing really work."

In an open seminar on information storage and retrieval, Norbert E. Andres of Advanced Digital Systems Inc. urged his audience to "save your tapes, they can go on-line now."

Saying that tape was the slowest of all on-line information systems, Andres said "the library rickshaw, the biggest bottleneck in the computer room, the most archaic operation in DP centers" was on its way out of existence with the approach of automatic tape retrieval.

The increase of density to 20,000 bit/in., the newer drives that accommodate the higher data rates, the application of video data at ultra high densities, and the reduction of human labor in both the recording and handling of tapes are all making tape on-line and are guaranteeing its survival for "a few more years," he said.

In still another seminar, Reid Henderson, president of Compu-Tek, Inc., and a CDP told his listeners management criticism that DP didn't contribute to corporate effectiveness was not only factual but was the result of inefficient planning at the DP level.

He cited examples of planning which included and encouraged the participation of user executives or personnel in the develop-

ment of systems usage.

DPAders, hurried a little by the shorter scheduling, gave the impression that the new format was appreciated.

"I liked it," said a DPMA member from Akron, Ohio. "The shorter time they gave the speakers seemed to make them work harder, made them take a lot of the irrelevance out."

"But then," he added, "there wasn't much time for questions, especially if you had another session to get to."

## Directors' Meeting Reveals Administrative Problems

(Continued from Page 1)

tional directors voted to establish a special office to deal with complaints of members and to outline more clearly the services available to the chapters and individual members.

The new directorate will be staffed full-time, reports from the meeting indicate, and will work through the local chapters and in some cases directly with the membership.

"This move should go a long way to solving some of the communications problems that presently exist between the international headquarters and the individual member," according to one international director.

"There have been a lot of premises in this area that deserve criticism," he said, "and this is the first time that the administrative staff has reacted positively on the issue."

"While many of the problems still remain," he concluded, "I think that the staff should be given a year to show that they can improve relations with members through the new setup. If things aren't better next year, then we should take more drastic action."

### International Scene

The problems in the international area still remain after the meeting here, however, and are more serious to an organization that wants an international scope and mandate, according to some association sources.

Reports circulating at the meeting concerned the possible pull-out of the Japanese DPMA groups from the international organization.

The Japanese cited the inability to get the Certificate in Data Processing exam printed in Japanese. The national DPMA in Japan numbers more than 2,000 domestic members but only 40 members in the Japanese DPMA. To date, there are no Japanese CDPs.

The international organization reportedly promised to get exams in Japanese out by May, but still has not set a new printing date.

Moves were also under way in the Canadian delegation to set up the Canadian chapter as a separate division instead of being part of divisions that also include U.S. chapters.

The move was seen as part of growing economic nationalism among some elements of the Canadian computer community and the fear of domination by the U.S. chapter.

### Budget Fight

The international directors' meeting also was the scene of a fight over the association's projected budget for the coming year, a fight that was resolved "with the introduction of a

more realistic spending plan," according to one of the attendees.

Originally, the organization had submitted a budget based on revenues from the dues of 200,000 members. It was made on the floor that took the budget down to the level that could be supported by dues from 100,000 members.

However, it was also revealed at the meeting that the association presently has only 26,514 members and that the international directorate said that even the trimmed budget was unrealistic in the light of present projected membership.

### Elitist Remarks

Elliott, the embattled executive director, said later that it is the nature of any association to react to crises instead of being able to plan in advance for any contingencies.

The organization is now reacting to past problems and sections taken at the meeting have served to clear up areas where there is a lack of communication or misunderstanding of the association's goal, Elliott said.

Many of the international directors contacted here agreed with his assessment and several said it was one of the most productive sessions in the organization's 20-year history—a landmark session in terms of "putting DPMA on the right course," according to one.

However, there are still some disenchanted directors and many who say if there are not positive results in the next year then more action will have to be taken.

"DPMA has shown by this struggling that it can move positively to meet legitimate grievances," one said. "I still think that there is time to save the organization and make it stronger than before."

## Sanders System Highlight Of Products Announced

**HOUSTON**—There were few major product announcements at the DPMA show here last week. Most of the exhibits displayed equipment already accepted and in use in the field.

The DPMA exhibit hall attracted several exhibitors who have defected from other industry shows including IBM and Univac, who dominated the floor as the only mainframe makers in attendance.

Most notable product an-

### New DPMA Officers

Newly elected DPMA officers are: Edward O. Linebeck, president; Herbert B. Safford of General Telephone, Santa Monica, Calif., executive vice-president; Eric Urd of P.S. Rose and Partners, Montreal, vice-president; David B. Johnston of Western Electric, Indianapolis, vice-president; Anthony J. Long of World Publishing Co., Cleveland, vice-president; Kenneth Sted of Virginia Commonwealth Services, Richmond, vice-president; James B. Sutton of Birmingham Trust National Bank, Birmingham, Ala., vice-president; J. Edward Palmer of RCA, Burlington, Mass., vice president; and William J. Diefenbach of Computer Sciences Corp., Silver Spring, Md., secretary-treasurer.

nouncement was the Sanders' 804 terminal system (see page 11). Computer-Link Corp. unveiled three new products, a disk pack inspector, cassette cleaner/reviewer and a tape evaluator/cleaner.

The Model 650 disk pack inspector checks IBM's 1316 or 2316 packs for critical faults.

The unit can be used for inspection of both 6-high and 16-high disk packs. The new 1,000 magnetic tape evaluator/cleaner may be used as a two-part tape cleaner with the file protect features. The unit is available with 7- or 9-track, full surface, or full width test format at \$56, 800 or 1,600 bit/in.

The Transcom Division of Hi-G cassette tape terminals with the introduction of the CT 300 line, consisting of two standard models which feature hard copy strip printer, numeric or alphanumeric keyboard, self-contained model and a magnetic tape cassette storage unit.

Optional features available include automatic answering (polling), originate answer, device control and acoustic coupling. Prices will range from \$1,825 to \$2,665, depending on model and features.

# Should Billing Dates Have Their Own Standards?

In a delightful letter J.T. Chamberlain, a New York information systems designer, proposes the addition of a 9th standard to the list appearing in the June 2 issue of *Computerworld*.

His standard is "Billing due date" and it seems to be reasonable with respect to the customer's individual requirements, as a result of a programmer's desire to level out computer work loads.

I think you will best get the flavor of his request by the following extract from his letter. "To substantiate—I am pinning on the last day of each month and have most of my bills by the fifth when I divide it up among all my deserving creditors. However, the telephone bill, dated the first, always arrives on the 10th and has to wait until the following month. They are nice,

They don't say anything.

"The Con Edison bill fell in this category but was on a two-month cycle and when it was changed to a one-month cycle, I began getting computer messages that accused me of being late when in reality Con Ed couldn't get the bill out on time.

"But the worst is R.H. Macy's which has a due date of the 28th of the month (when I'm really broke) after which it charges a high interest. Macy's probably loses several hundred dollars of sales a year because I go across the street."

There seem to be two points here—one, the timing of the billing date; and two, the most desirable timing of billing. Chamberlain tells me he has done a small private survey as to the way people hold back payments until such time as they are themselves paid. He reckons it is adding millions to firms' accounts receivable—he may be right.

But this does not make it a standard as I see it. A standard is something which should be obeyed. If Macy's does not want to get its bills paid on time—perhaps so as to receive that high interest charge—then let it up

to Macy's, as long as Macy's allows a reasonable period for payment.

## Approved Practices Possible

But this is not to say I should ignore this situation. It is a valuable and useful one. What we can do is take the Sanford rule: "A bill should be payable, and put underneath it an 'Approved Practice'—'Synchronizing billing dates with customer pay periods is an acceptable technique to reduce accounts receivable, and to avoid customer boycotts.' This can then be called the Chamberlain Practice and take its place in our book.

The second point he brings out, the Macy's case, may verge on another issue. His letter tells us he has been receiving Macy's bill less than 23 days before the payment is due. How much less we do not know.

But another reader, Stephen Metelits does know. His bill does not come from Macy's but from some Chicago-based Bankamerica. The due date this month was June 3. Metelits received the bill so late that if he had given it 24-hour turn-around it could not possibly have been returned in time.

It was postmarked on May 27 from Chicago to New Jersey. A field headed "Billing date" was included on the bill as being May 9. A Bankamerica leaflet description of this field said this was the date on which the bill was prepared.

Now I do not really believe this. It may have been the date on which the bill was scheduled to be prepared—but that is a very different factor. I wonder where Bankamerica kept all its bills from May 9 until it posted them on May 27.

Moreover, if in fact this was the date on which the bill was prepared, then I would have expected to see the date in some form punched into the card, along with the account balance, etc.

I checked the punching. It does not seem to me to include any dates. I have checked day of month, and month/c for the billing date and the due date. I do not see it there. As I see it, in order to run a system which uses the actual preparation date you would probably have it there.

Not that this really matters. The date on which a bill is prepared is irrelevant. The date that matters is the date on which it is presented. This can be regarded with some accuracy as the date it is put into the mail—May 27, or alternatively as the date it is received.

But certainly the idea of being able to slash bills away for 18 days (why not 30 days?) and

## Billing Practices

### Major Rule

A Bill Should Be Payable (Sanford Rule)

### Approved Practice

Synchronizing billing dates with customer's pay periods to reduce accounts receivable, and avoid customer boycotts. (Chamberlain Practice)

### Disapproved Practices

1. Due dates based on inaccurate or irrelevant date fields. If the mailing date is excluded from the face of a bill in favor of some other date (such as preparation date, or end-of-period date) then the bill should explicitly take into account all possible mailing and preparation delays. (Bankamerica case.)
2. Due dates of under 21 days after actual mailing date, when used for basing calculation of consumer interest payments. (Taylor Extension)

then claim interest on them is nonsense, it makes the bill "not payable."

So, in the same way that we have an approved practice, let us have a disapproved practice. As a matter of fact let us have two disapproved practices from this one.

One is the question of heading. Headings should be accurate. Moreover they should be directly relevant. In fact the date a bill is prepared is not relevant to the date it is paid unless it is promptly mailed. It only appears to be relevant in the absence of really relevant data.

In particular, if the system actually does not make provision for system delays, etc., and so will happily fall in May 9 as being the preparation date even though the computer is run on May 10, 11, or June 22, then this is wrong, and should be stopped. How about the following:

Due dates should not be based on inaccurate or irrelevant date fields. If the mailing date is excluded from the face of a bill in favor of some other date, such as preparation date, or end-of-period date, then due dates should explicitly take into ac-

count all possible mailing or preparation delays. Clear in the Metelits case they did not.

### Reasonable Delay

I wonder what you think a reasonable delay is. It works out this way. I think a person has a right to go on a two-week vacation, or business trip. And I think that he has a right to expect our mail service to take at least three working days for the bill to be received and checked, and for the check to be returned.

As such I cannot see any reasonable due date for consumer goods (it differs for firms) of under 21 days after it is mailed. They might even add this to the practice. It could read: "Due dates of under 21 days after actual mailing date are not considered reasonable for the calculation of consumer interest payments."

## The Taylor Report

By Alan Taylor, CDP

## CDP Organization

### Many Respondents Offer Help

Many offers of help were received in the early voting on the CDP Organization Questionnaire. CW, The Taylor Report, June 9. Some of the most frequently offered aid was in helping with local chapter organization—which came from Tennessee, Los Angeles, New York, Michigan, Washington, Texas, Seattle, Houston, San Diego, and Portland, Oregon, and Oklahoma City—and others. (A list will be published of local contacts when voting is complete.)

Other offers of help sometimes raised more questions than they answered. One IBM'er offered "My body and mind" leaving me to guess whether it was his soul or purse that he was defending!

Finance was not entirely ignored by others either. Dale Barrows of Bridgton, Me., suggested switching his dues from Barrows of Bridgton, Me., to El Segundo, Calif., was even more precise with his "Up to \$10/year dues (or more for an effective organization)." Well Steve—I haven't talked to anyone, but to be viable I think the dues may be \$20. The Mississippi-based Society of Certified Data Processors, a state-wide organization that started in April, also offered its help through Charles Guest. And, from the voting, it looked as though some help would certainly be needed—particularly about the name. The questionnaire had listed both the society's name and also that of the sponsoring Association of CDP Holders—but voting went strongly for the Society of Data Processors.

One possible way of distinguishing between the groups was suggested by the numerous requests to include the word American in the title.

Otherwise the vote continued to support an organization independent of DPMA. Only one vote, out of 200, was cast in favor of restricting membership to DPMA backed axams, while opening it up to people who passed any approved exam attracted 80 votes, almost as many as voted to make it CDP holders only (110).

The voting on both the questionnaire will be discussed at a meeting during the DPMA Houston get-together, and there should be some real news coming out soon. Thank you for voting (if you haven't voted, there is still time to send yours in).

## NEED A MORE FLEXIBLE DATA BASE STRUCTURE . . . . .

... to support that difficult application? Take a look at our List Management System which was developed for our LEVEL ONE, a generalized Financial Information System. LMS can be used independently with Cobol, PL/I or RAL to create data stacks and multiple threaded lists, or collectively with other access methods to create multiple formatted files which are dynamically flexible at execution time.

As a special introduction this system will be offered in the months of June and July to all interested concerns at \$5,000.00 which is a 75% discount. For further information write or call

JEFFERSON FINANCIAL SYSTEMS INC.  
177 North Franklin Street Chicago, Illinois 60606 (312) 372-8414

## SMART DATA RECORDER

The Tranti Sorcerer source data collection system, or "Smart" terminal, includes a keyboard, built-in calculator, program, paper tape printer, magnetic tape cassette recorder, and direct access modem for unattended computer polling. This portable instrument provides a unique, new and better method for off-line entry, processing, storage, and transmission of data in its source.

The Sorcerer is ideal for accounting, insurance collection, inventory control, fast food, and service bureau applications. Simply key account numbers and dollar entries—the recorder grinders, accumulates totals, and stores on magnetic tape. Entries are listed by the printer, and error alarm features guide the operator. Data is automatically transmitted on call from the computer.

For full details, please call or write:

**TRANITI SYSTEMS, INC.**

540 Main Street  
Tewksbury, Mass. 01876  
Tel. (617) 881-4600

## Car Pools, DP Go Together

PASADENA, Calif. — Members of the DP community are participating in various efforts to promote greater use of car pools in the Los Angeles area.

Burroughs Corp. is using one of its computers to form car pools for its employees, who are encouraged to join the program through special coffee get-togethers and preferred parking places.

Operation Oxygen, a Pasadena non-profit organization set up to unclog the freeways and make life more livable, is directed by Jack Novack, Burroughs' production manager. Another group, begun by Dr. Elliott R. Barkan of Cal State in San Bernardino, has 400 car pool members out of 2,000 students and faculty. Formed as Join Us, the group merged with Operation Oxygen.

The Los Angeles city traffic department is developing a pilot program that would use computers to match 3,000 employees now converging daily on city hall. If the system works it may be expanded to all city, county and federal employees who work in the civic center.

Other carpool programs being formed include four other colleges and universities, Aerospace Corp., San Bernardino, and San Bernardino County.

## Survey Shows Privacy Held Less Secure

WASHINGTON, D.C. — A group of labor, management, and government professionals have ranked the privacy issue among the top 10 policy issues facing Americans today. And 87% of the 103 participants in a special survey think that an individual's privacy is less secure than it was 10 years ago.

The people participating in the study were among those attending a recent forum on "The Privacy Battleground" held here and sponsored by the Transportation Institute and the AFL-CIO Maritime Trades Department.

Seventy percent of the respondents believed that when organizations computerize personal records from manual files they increase threats to privacy.

When asked what they thought

was the main reason organizations computerized personal records, 68% said to cut time and costs in managing manual records, 20% said to increase the amount of information describing each individual in the file.

According to the survey, 30% believed the effect on the individual of general technological change in the U.S. has been mostly beneficial while 21% said it has been mostly harmful. The largest segment, 37%, thought it was about equally beneficial and

D.C.  
Data-Line  
By Alan Drattell

harmful.

Dr. Alan F. Westin, professor of public law and government at Columbia University, and advisor to the forum, and S. Blumenthal of University Research Corp., Washington, conducted the poll.

A large segment of the group indicated personal experiences relating to privacy. For example, 73% said they had experienced billing or accounting error from organizations using computerized procedures.

A series of 37 policy statements relating to issues discussed during the three days of the forum were asked in the survey. Among them and the percentage supporting or opposing were:

- Law enforcement agencies making conviction records available to commercial agencies compiling pre-employment reports — 77% opposed.
- to credit bureaus — 82% opposed.
- Maintenance by law enforcement agencies of arrest records even when the person is not convicted — 78% opposed.
- Requiring a law enforcement agency to show an individual his own criminal record so he may contest its accuracy and completeness to such agency — 97% supported.
- Collection and maintenance by law enforcement agencies of investigative files about groups which, in the opinion of these agencies, might engage in criminal acts of violence — 32% supported, 51% opposed and 16% uncertain. But if it is in the opinion of a court issuing a warrant, then 60% supported it, and only 2% opposed.
- Use of credit bureau reports by a private employer in order to screen job applicants — 80% opposed.
- Credit bureaus furnishing credit histories on individuals to prospective lenders without informing the persons seeking credit — 92% opposed.

**Our 4800 bit modem.  
The thing that makes it  
so cheap is the same thing  
that makes it so good.**

4800 bits for \$3,325.

The secret is correlative coding (using our modified duobinary technique). It gives you an error rate of  $1 \times 10^{-4}$  at a signal-to-noise ratio of 20 dB. It gives you quick-polling (21.5 ms request-to-send/clear-to-send cycle). It gives you automatic error detection (eliminating the need for redundant parity check bits). And it gives you a very low price tag, all at the same time.

GTE Lenkurt invented correlative coding. That's why our 26D is the highest quality, most economical modem available for multipoint polled, C2 line operation.

For \$3,325, the 26D offers:  
Simplex, duplex or half-duplex operation.  
Transmit line equalizer.  
Receive line equalizer.

Self-contained power supply.

Built-in test facilities.

Full compatibility with EIA, CCITT and MIL interface specs.

Optional equalization indicator (\$250 extra).

Or, for \$300 less, you can get the 26D without pre-equalization, for point-to-point applications.

And when one of our 25B modems is hooked up to the 26D, you have a 150 bps secondary channel (for error control or low speed data) at no additional line cost.

Here's where you get them: Atlanta (404) 261-8282 / Chicago (312) 263-1321 / Dallas (214) 363-0286 / Falls Church (703) 533-3344 / San Carlos (415) 591-8461.

# Tab has 700 ways to make your computer work better.

## Here are 12.

<p><b>1:</b> Hanging Printout Binder Rack. Our new hanging printout binder rack is an adapter for use in all Tab Data Media Cabinets and Computer Storaways.</p> 	<p><b>2:</b> Horizontal Stack Rack. Organize your in-process tapes where the work is. Stores all 10 1/2" reels in racks and containers.</p> 	<p><b>3:</b> System/3 Card File. Save money and space by storing both disks and cards in one convenient cabinet. Available in 20, 28, and 40 compartment sizes.</p> 	<p><b>4:</b> Tiltshelf Tape Storage. Tiltshelf doubles your tape library storage capabilities. Reels are housed in bays, 2 deep on a shelf with a 4° forward slope.</p> 
<p><b>5:</b> Super Seal. Tab's Super Seal features a molded-in hook, polypropylene plastic throughout, optimum performance and tape protection, plus a lifetime 10 times that of ordinary seals.</p> 	<p><b>6:</b> Magic Aisle. We'll help you get maximum density filing storage with Magic Aisle (a patented system of tracking carriages custom built to condense mass storage of data media). You can use that extra 30% of your current storage area for something else.</p> 	<p><b>7:</b> Tab 2380 Bursler. Burst, decode, inspect, slit and stack in one pass with the new 2380 Bursler. It's a multi-process machine in one unit. You can run 340 feet per minute to handle anything from 14" long printouts to the smallest form cards.</p> 	<p><b>11:</b> Microfilm/MTST Carousel. Get space-saving, high density storage for 35mm and COM generated 16mm cartridges. Modular design allows quick expansion of low cost.</p> 
<p><b>8:</b> Data Media Cabinets. You can store everything from reels, disk packs, printout binders, and card trays to the company coffee pot in a Data Media Cabinet. Choose from two, three or five compartment models in computer compatible colors.</p> 	<p><b>9:</b> Data Display Desk. We blended function and fashion perfectly into the 300 series Data Display Desk. Available in 45" and 62" widths. Ideal for input terminals, reader/prieter stations, or programmer's desk.</p> 	<p><b>10:</b> Tab Computer Storaways. Use them in basic or varied combinations to store disk packs, tapes, manuals, or whatever. And use the counter-high top for extra work space.</p> 	
<p><b>12:</b> Sales &amp; Service. Fill out this coupon and we'll send you all the product information you want. We'll also tell you how to contact one of our 100 sales and service offices throughout the United States. Your Tab representative is ready to help you with your necessary needs. Or have him show you our other 688 ways to make your computer work better.</p> <p>1. Hanging Printout Binder Rack 2. Horizontal Stack Rack 3. System/3 Card Files 4. Tiltshelf Tape Storage 5. ### The Ten Commands

### Of Data Security

1. Thou shalt not take security for granted.
2. Thou shalt provide for adequate personnel clearances.
3. Thou shalt establish restricted areas.
4. Thou shalt provide fire control and prevention measures.
5. Thou shalt provide for theft-detection.
6. Thou shalt provide for sabotage detection.
7. Thou shalt establish riot and mob controls for entry and egress.
8. Thou shalt not overlook back-up equipment requirements.
9. Thou shalt generate back-up data bases.
10. Thou shalt be security minded in the physical planning of computer facilities.

... By Lou Sooma, President of Data Processing Security, Inc.

By Edward J. Bride  
CW Staff Writer

All roads in this "More" supplement lead to security. If you consider your data center secure, maybe the suggestions of industry experts will make it "more secure."

The items and procedures in this supplement are those normally budgeted or considered separately from CPUs, CRTs, COMs or core (or other) memories.

Hardly any DP expenditure can be called "incidental," for every item is intended to improve one facet of business operation in these days when DP executives

must assure tight security despite even lighter money.

Improvements in the environment of a DP center translate into a more secure position for the manager concerned about his humidity, dust or other contamination?

Proper treatment and use of accessories lead to security from data errors and possibly killing inaccuracies and consumer problems.

One article in this supplement will explain what is happening to computer users' power needs, and point the way towards more reliable electric power, furthering users' security from unscheduled downtime or errors.

The methods one user implemented to assure software security will show other users how to recover from natural disasters or other occurrences which might jeopardize security.

There is concern today over the "more" areas of supplies,

accessories and environment, as they affect the overall security of data centers. This supplement is intended to make users more informed with the devices available to make their centers operate more effectively.

So, if your controlled environment depends on utility-supplied power and not your own, maybe some ideas here will assure "more" control, for more reliable energy and a better environment.

The procedures of auditing your system and planning for the worst will help you discover some of the methods you can use to get "more" reliability from your system, bringing security from internal hazards.

While you may already manage some type of DP installation, the pages that follow will help you discover how, through better security, accessories and environment, you can get "more" from your computer.

### Water Still Best?

## Special Fire Needs Cited for DP Users

By Robert V. Jacobson  
Special to Computerworld

The best possible protection against catastrophic fire loss is probably provided by an automatic sprinkler system, a conclusion reached after consideration of several facts.

- Automatic sprinkler systems have an enviable record of success where properly installed and maintained. The National Fire Prevention Association (NFPA) reports satisfactory performance in 96.2% of reported cases from 1925 to 1964.

Nearly half of the unsatisfactory reports were caused by the water being shut off.

This excellent record might be attributed largely to the "solid state" construction of these automatic systems.

- Automatic sprinklers will provide prompt cooling and so limit corrosion damage.
- No significant personnel hazard is involved.

Modern construction, grounded metal cabinets and power cables under the raised floor, the possibility of electric shock should not cause alarm.

Furthermore, in the event of a catastrophic fire, it should be possible to cut off electric power with an emergency power disconnect switch, a mandatory feature of any computer room.

- Automatic sprinkler systems can be refurbished quickly with little or no break in fire extinguishing capability.

- The cost of installation is relatively low, approximately \$1 per square foot, and the cost to refurbish after a fire is extremely low.
- The probability of a false discharge is very low. Sprinkler pipes and heads are ruggedly constructed and when properly installed should give little or no trouble.

The ideal sprinkler system for data processing is

the pre-action with recycle type which works in the following manner. Pipes are normally dry. If heat detectors associated with the sprinkler heads detect a rise in temperature, a solenoid valve opens allowing the pipes to fill.

When the heat melts a head linkage over the fire, water is discharged. After the head detector senses a temperature drop, the solenoid valve closes and stops the water.

Pre-action is preferred to dry pipe systems because with the latter there is a significant delay between the time the head opens and the water discharges. The fire has more time to get established, which may cause additional heads to open, thereby reducing effectiveness if water pressure is low and also increasing water damage.

Furthermore, pre-action prevents the release of water if a head is accidentally broken. The recycle feature will limit water damage without reducing subsequent fire extinguishing capability.

Pre-action/recycle systems should include internal batteries for emergency power and will fail, thereby reducing individual components of the control system fail, at the very worst the system will revert to conventional wet pipe operation and so still provide a high level of protection.

### "Higher" Halon Cost

Systems which use halogenated agents such as Halon 1301 appear to have several drawbacks when applied to computer room protection.

The cost is significantly higher, approximately 50 cents per cubic foot or \$5 per square foot with a 10-ft ceiling to floor slab dimension. Recharging is also costly, about one half the initial cost, and until the system is recharged it offers no protection although there is always a significant probability that the initial fire may reignite.

Continued on Supplement/5

## User Can Prevent Power Brownouts, 'Transients'

By Ralph A. Amos  
Special to Computerworld

Aside from the prospects for continued brownout conditions and high frequency of equipment failure due to overloading, the computer user is faced with power problems over which he has little or no control.

Short-term outages lasting a minute or longer, and momentary outages lasting from about 100 msec to one minute are quite obvious as they will be visually discernible. They will also necessitate considerable re-run time whenever they occur.

High-speed power transients, lasting less than 100 msec are not normally visually discernible and thus can be more troublesome in today's advanced computer hardware.

This type of transient may cause nothing more serious than a misspelled name or a word in a printout, or it may be of such magnitude to cause a complete program interrupt. This "Class III" (short duration) problem has been largely ignored by both utilities and hardware manufacturers until the last two years.

Logging Class III faults with high-speed voltage monitors indicates that statistically the problem is pretty much the same from one utility to another, and from one geographic location to another.

### High-Speed Switching

This type of fault is most common the most result of high-speed switching.

Continued on Supplement/6

## True Jeopardy 'Inside,' Auditor Says

By Richard A. Hirschfield  
Special to Computerworld

The greatest exposure in on-line systems often comes not from vandalism or the theft of a tape, but from illegal or unauthorized access through a remote terminal.

Unauthorized access may be accidental, or worse, may be clandestine and go unnoticed or unreported. Does it happen? You bet! Often? No one really knows.

Just reflect on the octopus computer with its two-way tentacles stretching your vulnerability in ways you never thought of before.

The on-line control problem has four dimensions:

- The prevention of illegal or

unauthorized access to the computer and its data files.

- The control of data transferred from remote locations to the central computer complex.
- Backup and recovery systems for the computer complex.
- System auditability.

Assuming the necessary controls are designed into the system to prevent unauthorized or illegal access, the user must still concern himself with securing the operational environment.

Several levels of controls are necessary, the most common being the familiar terminal and line-checking features such as horizontal and vertical parity, bit counts and sequential message numbers.

Some less familiar yet poten-

tially critical controls over data transfer should be addressed, these being computer logs, encrypting of data and closed loop verification.

### Computer Logs

In an on-line system a complete log should be kept within the computer of every terminal access to the computer to record the time of access, the terminal number and user password, and the purpose of the access.

It must be maintained on a real-time basis and information printed out from it on a daily basis for review. Items of special interest, such as attempts to gain access to files with illegal passwords, should be flagged.

Continued on Supplement/2

# Dirt, Smog, Heat, Static All Threaten Disk Accuracy

By Ron Kubec

Special to Computerworld

The introduction of rotating memories into data processing has necessitated more demanding requirements for both manufacturer and user to create and maintain acceptable operating environments for these devices.

Data security is not just a matter of protection from fire and theft.

There are two major criteria for generating a suitable operating environment for rotating memories—ensuring read/write accuracy in operating and protecting the machine and the recording media during both active and inactive periods.

Read/write accuracy is, of course, the primary objective in the design, production and maintenance of the devices. Therefore, it must not be disregarded when using the drives.

This requires the control of the electrical and magnetic environment. Electrical noise, whether generated by nylon

parties or less exciting devices such as electric erasers, must be controlled.

Excessive magnetic fields can cause erasure of recorded surfaces or distortion of data as it is transmitted.

In protecting the machine and the recording media during active and inactive periods, consideration must be given to environmental factors.

These may be represented by two types: particulates, such as debris and smog; and chemicals, such as sulfur and salt.

Particulates can be introduced through dirt on parts in the assembly area, through bad design (for example, excessive use of anodized parts), or they may just fall out of the air. Hard, sand-like particulates are especially bad because they tend to become imbedded in the disk and lead to data errors.

Flying a read/write head in a smoggy environment causes this material to be deposited on the leading edges of the head. Eventually this build-up reaches a

level that causes the head to crash into the disk.

All of these problems are overcome by cleaning parts, assembling them in clean rooms, and providing clean, positively pressurized head/disk area, and by using absolute filtration systems.

Control of temperature and humidity is a major influence on the interchangeability of disk cartridges and packs among drives, and is a prime constraint to overall system performance.

Extreme temperatures affect the performance of rotating memories mechanically as well as electrically. Low temperatures reduce the effectiveness of lubricants, contract dissimilar materials, and cause wire insulation to become inflexible.

High temperatures cause electronic components to perform erratically and can melt insulation.

Humidity must be maintained at a level that does not permit condensation and

static electricity.

Disk cartridges or packs should be kept at or near room temperature. This will insure that their temperature is not too greatly different from that of the disk drive enclosure, and thus will prevent condensation and expansion or contraction of materials during drive operations.

This helps to guarantee the ability to interchange cartridges or packs among different drives without causing errors.

Ron Kubec is senior engineer at Ibmec, Inc.

## On-Line Environment Is Special Hazard, Demands Cautions

Continued from Supplement/1

In addition to the log, the use of closed loop verification can insure that all data transmitted to the system has been received as transmitted. This confirmation, transmitted from the computer to the terminal contains a message number, the time of day, and a character or bit count which should correspond to the character and bit count transmitted.

All public lines are subject to being tapped or electronically monitored without the user's knowledge. Even private lines are not completely secure and microwave may prove to be the least secure of all.

Thus, when sensitive data is transmitted, the user must realize that through a concentrated effort on the part of a malicious intruder, this data can be obtained. If the data is that sensitive, then the only recourse is to encrypt the data.

The use of encrypting is growing among many companies which transmit confidential data and of course is heavily used by the U.S. Government. Many users have even begun encrypting the actual data files in the computer for maximum security.

The subject of backup systems is important in an on-line environment. Often the applications processed and their immediacy do not allow the system to be down for any extended period of time.

Depending on the criticalness of the processing, on-line systems may have to be duplexed or in some cases even "triple-duplexed" to assure an uninterrupted flow of processing.

An often overlooked point is that if the user is to go to this expense and difficulty he must also consider the backup requirements of his power supply, air conditioning, etc., and provide proper switching mechanisms to assure that backup transfer can be affected when necessary.

Auditors should be able to review the integrity of the controls and security of an ongoing system.

The effectiveness of the controls should be determined to ensure they are properly working and also to detect any changes to system control and security levels. With less hard copy being produced, the traditional audit trail is vanishing and the auditor must develop new techniques for validating the effectiveness of new controls and security requirements.

The on-line user should realize that implementation of such measures is complicated and expensive and can add significant overhead to systems operations.

Richard A. Hirschfeld is executive vice-president of Computer Audit Systems, Inc.

### Editor's Note

The "More" supplement was compiled and edited by Staff Writer Edward J. Bride, who joined CW in November 1969 after being discharged from the Navy.

Bride's Navy training included weapons guidance systems, analog computers, personnel, public affairs and DP administration.

# Epoch 4 cuts handling damage 50%.

## How does that grab you?

Nine out of ten dropouts are caused by handling damage. Squeezed flanges. Dropped reels. Improper mounting. Plain carelessness.

So how can Epoch 4 reduce handling damage 50% or more? Because its unique new binder system bends without breaking. And stretches without cracking. So Epoch 4 can take the kind of handling that would ruin a conventional tape.

We don't promise Epoch 4 will eliminate all handling

damage. No tape can do that.

But, because Epoch 4 is 80 times tougher than conventional tape, it can easily reduce dropouts 50% in the average installation.

Is this kind of performance worth a few dollars extra per reel? You bet it is.

Think about how much handling damage is costing you every day.

Then grab onto Epoch 4. You'll never let go.

**GRAHAM  
MAGNETICS**

Graham, Texas 76046

## Paper Affects Printer's Effectiveness: St. Regis

By Richard Jordan  
Special to Computerworld

Because of collating, cost, and clarity problems associated with multiple-copy computer print-out, the trend has been for forms designers and systems analysts to specify fewer copies, not more.

There are still many instances when six or more copies are required, and carbonless or carbon/bond paper can help alleviate some of the headaches.

In the case of high-speed computer printers, there are several factors that affect the ability of any given printer to reproduce legible prints, including the make and model of the printer itself, the setting for print den-

sity and the distance between the printing mechanism and the paper.

Another factor is the mechanical condition of the printer.

Chain-type printers generally reproduce a more legible print than do drum-type printers. The type of ribbon used on the printer also affects the printout. Thin, 3 mil, nylon or plastic-based ribbons generally supply a better print and more copies than do thick, fabric-based ribbons.

It is anticipated that shortly, all carbonless papers will be priced to compete favorably with many present combinations of bond and carbon. At that time the volume required may

be many times the quantity presently in use. In addition, new applications are being found every day.

Applications enabling the computer to scan optically either handwritten copy or copy reproduced by a machine are very promising applications. Thus, carbonless papers can be used not only for output, but also for input.

Richard Jordan is Product Development Manager of the Graphics Paper Division, St. Regis Co.

## New Carbonless Use Seen, 'Paper Cheap,' Says NCR

By J.M. Winkoff

Special to Computerworld

Compare the basic price of a continuous form printed on carbonless paper and a form using bond and one-time carbon, and the carbonless form will usually be more expensive. But more and more systems and DP managers are realizing that the initial price of the form is not the total cost.

To compute the true cost of a form one has to add the cost of the handling involved. In other words, how much does it cost to decollate the form (there's an extra step here with a bond and carbon form)?

How much time is involved with any hand entries which must be made? What are the cost consequences for errors from carbon paper smudge?

The true cost of a form thus goes far beyond the basic price, and costed correctly, a carbonless form will usually cost less.

It's the old story—paper is cheap, but people are expensive. In fact, the people cost is becoming so important that some installations are sending out continuous forms just as they—upside off the printer and forcing the receiving department to do its own decollating.

The difference between the basic price of carbonless and bond and carbon forms has been narrowing in the past few years.

The convenience factor has been one of the chief advantages of carbonless continuous forms, and it really becomes a factor when the output document is destined for the hands of the general public, where one does not want the message to be smeared or run the risk of an irritating carbon smudge on the consumer. As more varied uses are developed for computers, the forms industry is required to keep pace. Carbonless paper is being increasingly used because it is uniquely suited to many of these advanced applications.

OCR, turnaround documents and unitized mailers are three such applications. J.M. Winkoff is a forms specialist at the National Cash Register Co.

## Keep unauthorized people out of your computer room

# DATALOCK

...an all new, solid state electronic keyboard and control unit designed and manufactured for computer room security

DATALOCK is an access control system and is easily installed in existing door locks allowing quick entry to authorized personnel only.

DATALOCK gives you positive control and restricts unauthorized people from your valuable computer facilities. No keys or cards to buy, replace or worry about.

DATALOCK's electronic keyboard combinations are quickly changed in seconds by simply turning four rotary switches in the control unit. Change combinations each day or each shift or whenever the security of your computer room is compromised.

DATALOCK's unique built-in features include a visitor's call button, pre-set and audible alarm system if the keyboard is tampered with and three indicator lights that show the operational status of DATALOCK at all times. Battery back-up, intercom, camera and other options are available. DATALOCK is compatible with all intrusion alarm systems.

DATALOCK has proven reliability for computer room security in leading banks and commercial institutions.

## Recovery Possible? Not Without Backup

By Harold Weiss  
Special to Computerworld

Just about every month a number of disasters afflict DP installations. Most are not reported in the press and are not widely known.

If the computer center is physically destroyed or seriously damaged, it will be very costly, requiring perhaps millions of dollars to return to the status quo, if it can be done at all.

There is a serious question about whether recovery from true disaster is indeed feasible for the highly integrated computer user, given even what is considered good risk practice in the computer field today. Would the organization have to shut down for a lengthy period of time until adequate computer service was restored or would it pile up a fantastic backlog of data processing? How efficient would it be during the restoration period? How much would it cost to recover if recovery was still possible?

It is predicted that a number of organizations will go out of business in the next decade because of major DP disasters.

Fallback to manual or other methods of data processing is rarely feasible in the event of true EDP disaster. Remote back-up installations will not normally begin to solve the problem either.

Other parts of the organization besides data processing must be involved in disaster planning, including top management and insurance, security and records specialists... even the janitor may have a constructive role to play. A crash program of risk reduction is probably in order for every computer user.

Harold Weiss is director of the Automation Training Center.

## All Agents Have Place Fighting Computer Fire

Continued from Supplement/1  
The heat of the fire may cause the agent to decompose into highly corrosive and toxic compounds.

If the agent is released quickly through a well engineered array of nozzles, effective concentrations can be achieved in the room air. Tests with simulated computer cabinets, however, have cast serious doubts on the ability to achieve good distribution inside the cabinets unless cooling fans are operating. There is a real danger that fire has also made these fans inoperative, so it seems imprudent to depend on halogenated agents to deal with such fires.

Also, the Halon discharge is controlled directly by the smoke detection system and each false alarm, if not promptly aborted, leads to an expensive recharge. Over-zealousness in aborting discharge may some day lead to undue delay in attacking a fire.

### Room Size a Factor

Tape and disk storage areas present quite a different picture. If one follows NFPA Standard No. 75, each room is no larger than 5,000 cubic feet, so even distribution can be more surely accomplished.

If electrical equipment such as tape cleaners are not kept in the room, the problem of hard-to-extinguish electric cabinet fires is eliminated. The room then does not need extensive air conditioning ducts, and should be easy to seal off to that the halogenated agent has ample time to work.

Halogenated agents offer no damaging side effects to tape and disk contents - a major advantage.

### MOVING?

Please notify *Computerworld* at least four weeks in advance. And be sure to enclose a mailing label from a recent issue; it will help us provide you better service.

With regular inspection, Halon 1301 would appear to be an ideal fire protection system for tape and disk storage rooms.

Carbon dioxide systems are similar in construction and operation to Halon 1301 systems but cause no direct damage and are free from corrosive or toxic by-products. On the other hand, at effective concentrations the supply of oxygen in the air is too low to sustain life. There is also the possibility of fog formation which can make escape difficult.

Carbon dioxide systems are about 10% less expensive than Halon 1301, but considering all factors, Halon 1301 appears to be preferable to carbon dioxide for the protection of tape and disk storage areas.

Robert V. Jacobson is president of Bradford Security Systems, Inc., of New York (formerly Bradford Associates, of Wellesley, Mass.).

# User Tells How 'Lucky' Accident Brought Awareness

By Philip J. Berg

Special to Computerworld

A "lucky" accident—a burst water pipe—taught our suburban Washington data center a lesson about backup, and an airplane crash into our Princeton, N.J., offices reiterated the need for security precautions of data.

The following list is proposed as the minimum requirements in order to prevent, or minimize, physical damage in cases of catastrophe, power problems, or just plain bad luck.

It is vitally important to delegate specific responsibility to all personnel, to avoid the disastrous effects that panic can cause to both lives and property. A "plan of action" must be devised.

The surest security measure is backup systems, but the amount and frequency of backup should be based on the amount and frequency of system activity (for example, if certain files are updated only once a month, a backup tape for that file

need be generated only monthly).

Closely allied to generating sufficient backup is providing safe storage for that backup, with duplicates in remote locations.

With cost a consideration, users should know exactly what should be backed up. This is a function of how easily the original data could be recreated if it were destroyed.

Evaluate protective measures periodically, and attempt to recover data from existing backup. This will reveal strengths and weaknesses of existing procedures.

Avoid program interdependency; if "program X" must be available to regenerate from existing backup tapes, what happens if "program X" is destroyed?

Purge backup of unessential material, to keep this data accurate and up-to-date. Be absolutely certain that any data which is evaporated is truly useless.

Document procedures comprehensively,

and safely store the documentation.

All operations staff must be familiar with procedures.

Find out if there is another DP facility with comparable equipment in the vicinity, and if possible, a mutually advantageous agreement should be arranged if damage occurs to either party.

Structure systems' basic designs so they

inherently provide a certain measure of backup. The backup operation can be oriented to reflect the actual frequency of activity.

By eliminating some of the manual aspects of data center security, the entire system becomes less expensive.

Philip J. Berg is *Autoflow Technical Manager for Applied Data Research, Inc.*

## User Power Concern Continues

Continued from Supplement/1  
speed switching of the utilities to correct the local power factor and/or voltage as the load changes during the daily cycle. It apparently shows little geographical variation.

It has been difficult to establish any exact correlation between these high-speed disturbances and computer errors. EDP managers, using an uninterruptible power source (UPS), generally feel that

unexplained errors are noticeably less. A few contend that the UPS is justified on this basis alone.

If you do not already have such a system on order, do not expect to get one installed this summer. You do have time, however, for a thorough management evaluation of the critical level of your DP operation in relation to the effect future power problems will have on the continuity of your system.

The interim suggestions and recommendations below should help you through the critical period until suitable power arrangements or power systems are assured.

- Check system voltage at distribution panels in the computer room. If the voltage is lower than specified by the computer manufacturer, it can usually be raised by changing transformer taps in the electrical distribution system supplying the computer. There may be three possible points this can be accomplished: the computer room transformer, the main building transformer or the utility company's transformer.

This operation is a very simple and inexpensive one, requiring about eight hours of labor, and can be done by in-house electrical maintenance personnel or an outside contractor. The utility will normally change transformer taps at no charge if you request it.

A power off time of at least one hour is required for tap changing.

You should first determine utility voltage range over at least a 24-hour period and a full week if possible. This can be done on a spot check basis or by a recording voltmeter and will determine what tap setting should be used. Utility voltage will usually increase during off peak loading. (Late at night and weekends). Excessive voltage levels can damage your hardware.

- Check your complete computer circuit for overloading from service entrance to computer room distribution panel. Any cables or circuit breakers which feel hot to the touch should be checked with a portable ammeter for excessive load.

### Overload to Problem

The power check is quick and inexpensive. Solving the overload problem may not be so simple. The solution can vary all the way from cleaning breaker contacts and ventilating the power distribution area, to a new service.

- Check ventilation in your power panel area. Low voltage conditions usually cause wiring and circuit breakers to run hotter than normal, increasing the chances of the breaker tripping and "dropping" your computer. The solution to this problem is usually relatively simple. Installation of a fan or tapping a nearby air conditioning duct may suffice.

- Redistributing your work load so that your maximum production load does not coincide with the utilities maximum load. This will reduce the probability of a power interruption during critical work periods. You could encounter personnel problems with this suggestion because it will necessitate more of your people working the two night shifts.

These suggestions will minimize the effect of brownouts and hopefully reduce potential outages.

Ralph A. Amos is vice-president of Power Systems & Controls, Inc., Richmond, Va.

# The computer performance protector. At \$1585 it's a bargain!

Sure our Model 215 portable particle monitor for computer rooms costs money.

But, look at what you invested in your computer installation in the first place. And, computer room contamination is costing you more in down-time, errors and memory damage right now.

Wouldn't you rather have performance protection for your computer room?

And save money, too.

Maybe you're wondering what our Model 215 portable particle monitor does to protect computer performance.

Well, to begin with, it continuously counts airborne particles that contaminate

computer room environments

and infiltrate rotating memory systems.

If contaminants build-up past the safe level or, if filters malfunction, our Model 215 tells you about it. Before your computer room environment goes critical. Before you suffer hardware and data damage.

That's what our Model 215 portable particle monitor is all about. Contaminant build-up detection. That's positive performance protection. Think about it.

And, our Model 215 is simple to use. Anywhere. In the computer room or in the field. It works on AC or DC power; weighs only a few pounds

complete with rechargeable battery and carrying case.

So, if you're wondering whether it pays for you to buy our Model 215 portable particle monitor, just remember this.

Your computer and memory systems aren't doing you any good if they're not working. Our Model 215 keeps them on the job.

Also available: Our Model 205/108 memory protector. Positive head crash protection from \$59.50 a month.

## Random Notes

**Waste Management Package Plans 'Recycling' Pickups**

SUN VALLEY, Calif. — Operators of multiple truck waste pickup and disposal fleets can gain better control over their operations with the management information system developed by Computer Management Systems (CMS).

In addition to accounts receivable and sales analysis processing, the system includes "objective routing control" to group pickups of similar salvable items for recycling. The system is operational on an NCR Century 200 and is available for franchise from CMS at 9200 Gleasons Blvd., 91352.

**DOS Users Get Mark IV Version For Processing in Foreground**

CANOGA PARK, Calif. — DOS/360 installations can use a new version of the Mark IV File Management System from Informatics Inc., in either foreground or background partitions.

The foreground capability includes all the capabilities of the standard Mark IV, but separate tapes are required for the two foreground partitions. The firm is at 21050 Vanowen St., 91303.

**Dartmouth T/S Raising Rates To Recover Missed Billings**

HANOVER, N.H. — Users of the Dartmouth Time-Sharing System face an upward revision in rates due to details of the increase have not been completed.

The increase in rates will be needed, DTSS said, to offset the effect of a programming error, since corrected, which allowed up to 40% of CPU time used to go unbillable for a period of several months.

**Cybernet Adds Graphics Service**  
ANN ARBOR, Mich. — Users of the Cybernet time-sharing service can generate high-quality X-Y plots interactively and have results displayed on in-house CRT terminals or on plotters at network computer centers by using the Cybergraph program.

Cybernetics is at 333 Maple Village Center.

**Shipbuilders Get Library**

MINNEAPOLIS, Minn. — Shipbuilding groups can avoid the cost of developing design assistance programs by using a library available on the Cybernet time-sharing network of Control Data Corp.

The library, organized by the U.S. Naval Ship Systems Command and the Shipbuilding Industry Advisory Committee, includes programs to study pipe sizing, hull characteristics, electrical systems and propeller parameters and performance calculations. CDC and Cybernet are headquartered here.

**Building Design Aided on Hiso**  
MINNEAPOLIS, Minn. — Engineers and architects are able to plan elevator systems and environmental control systems with the Building Utilities Design System (Buds) on the Hiso well Information Services Operation network.

Buds permits analysis of building energy consumption and demand, and analysis of hydraulic or gas distribution networks. Hiso said. There are 11 programs in the system and most do not require user knowledge of programming. Hiso is at 2701 Fourth Ave., 55408.

## Forecasting Included

## Inventory Keyed to Customer Service

By Don Levitt  
c/w staff writer

BURLINGTON, Mass. — An inventory management system that includes forecasting modules and user-defined parameters for level of customer service is available for medium-scale 360 installations from Manufacturing Management Sciences Inc. (MMS).

The forecasting modules analyze de-

mand history and select the most appropriate from among seasonal, trend, "lumpy" or horizontal forecasting models. The user may force selection of a particular model, if factors that dictate such a choice are not reflected in the data. Adaptive smoothing techniques are used by the system to minimize forecasting errors, MMS said.

The MMS package creates and maintains

all files necessary to operate the inventory system. The system has four major files to utilize a chaining technique for random processing in any sequence.

In addition to inventory master and open orders and reservation files, the system supports a warehouse file showing inventory by stocking point. A period transaction file contains full audit trails so that transactions can be traced. Data can be transferred to a history file for long-term use. This file contains 24 periods of previous demand plus monthly projection information, the company said.

The system not only allows the user to define the level of customer service to be maintained, but computes the safety stock level based on either time service or unit service, an MMS spokesman said.

The system is designed to run on a 64K IBM 360 with three 2311 disk drives or a 2314. Written in Cobol, versions are available for either DOS or OS. The floating point option is required.

The package costs from \$20,000 for a single warehouse, DOS version to \$35,000 for a multiple warehouse, OS system.

MMS is at 279 Cambridge St., 01803.

## Seven Tasks Run Simultaneously Under DOS TP Control Software

BALA CYNWYD, Pa. — Seven application subtasks can be run asynchronously in an IBM DOS/360 environment, with Top Processing/Master Control Program (TPMCP) from Automated Financial Systems Inc. (AFS).

TPMCP is written in Assembler Language utilizing IBM's Basic Telecommunications Access Method (BTAM). The monitor system is designed to meet all the "front-end" requirements of an installation, and supports any IBM-compatible terminals, AFS said.

The program is said to support serially reusable, non-reusable, reentrant or self-relocating applications written in Assembler, Cobol or PL/I. No changes are said to be required in the user's coding.

TPMCP itself uses reentrant coding wherever appropriate to allow more effective use of monitor facilities.

The opening and closing of communication lines and files, and other elements for control of the system, can be handled by an instructor at a master terminal or at the CPU.

By duplicating on disk the coding of each application and/or module of the monitor as it is accessed, TPMCP allows virtually instantaneous recovery from execution errors. If the problem arises in an application, for example, a core dump is put out on tape or disk and the system goes on to the next task. The next time

that program is needed, the "clean" duplicate copy is used, an AFS source said.

TPMCP requires at least 27K under DOS/360. A more typical core requirement would be 80K which, the company said, would support seven or eight applications, two or three terminals and 15 files.

Five man-days of support are provided in the base price of \$18,500 but customization and special installation costs are additional. Lease plans are also available from AFS at One Decker Square, 19004.

## 'Faas' Calculates Depreciation

NEEDHAM, Mass. — Financial managers with access to an IBM 360 as small as an 8K Model 20 can use the Fixed Asset Accounting System (Faas) from McCormack & Dodge Corp. The system includes separate accounting for tax and bookkeeping purposes.

In addition to the tax and bookkeeping depreciation calculation programs, Faas has programs to provide projections for analysis and budget preparation. Various programs list the asset file sequentially by item number within location, by account, by acquisition date or by other significant characteristic.

Another program calculates depreciation through date of retirement upon the

complete or partial disposal of an asset. Assets acquired prior to the Tax Reform Act of 1969 will be analyzed for possible Investment Tax Credit recapture, a spokesman said.

The system can be run on a card-oriented 360/20 with 8K of memory or a tape/disk-based Model 20 with 12K. A DOS version functions on a 360/25 or larger CPU under DOS with 24K and three tapes or two disks. The OS version takes 64K of memory on a 360/30.

The 360/20 package costs \$495. An RPC-based Faas for the larger CPUs costs \$695. Source programs written in Cobol are available for \$745, from the firm at 19 Brook Road, 02194.

## Banks Handle General Ledgers With Program on National CSS

WAKEFIELD, Mass. — Small to medium-sized banks with already crowded in-house equipment can run their general ledger accounting on a time-shared basis, with a program developed by TLM Systems Associates and available on the National CSS network.

The package is available from TLM for \$1,000 plus customization, plus a monthly maintenance and use charge of \$100 to \$150, once it has been implemented on National CSS. The network charges separately, at its standard rates, for machine time and other facilities used while running the TLM system. TLM Systems Associates is at 2 Smith St., 01880.

## 'Scribe' Manages Subscription Accounts

NEW YORK — Publishers can implement most of their subscription fulfillment and accounts receivable processing on a medium-scale IBM 360 or RCA Spectra 70 with the Scribe package from FDA Systems Inc.

The package provides all types of mailing labels for the publication's own operations, billing for both subscriber and advertiser accounts, and special labels to handle reader inquiries.

In addition to billing, the accounts receivable portion of Scribe also outstanding balances and handles commissions for commercial accounts.

Written largely in Cobol, with some subroutines in Assembly Language, Scribe has been implemented on a 65K IBM 360/30. Adapting the package to the RCA Spectra 70 should be relatively easy, according to the company. The \$2,000 package can be ordered from 12 East 86th St., 10028.

## Rochester to Charge 300% More Than Bell, PSC Told

ALBANY, N.Y. — The Rochester Telephone Corp. proposed tariff sets rates so high that it "gives only lip service to interconnection," according to Curt Gamlin of Telcel Associates.

Testifying at the latest sessions of continuing New York Public Service Commission hearings [CW, May 12], Gamlin said the proposed Rochester Telephone charges for lines with customer-owned equipment are 300% of similar rates set by New York Telephone Co.

Commenting on Rochester's proposed semiannual inspection of customer-owned equipment, Gamlin told the PSC that in many cases both Rochester-provided and customer-provided units will be identical.

Citing the plans of Neisner Bros. Inc., a local data user, Gamlin said Neisner would use Northern Electric equipment when the proposed tariff takes effect. The telephone company

would probably install the same equipment, Gamlin said. The major difference would be that if Neisner installs the equipment under the tariff it would be subject to higher rates and twice-yearly inspections. But if Rochester Telephone installs the units, "they may inspect only every two years," and charge lower rates, Gamlin said.

Rochester Telephone did develop a "simplified network [protective] device," he said, but there is no justification for the carrier to set anything more than a nominal monthly charge.

Rochester Telephone disclosed that it will allow the multiplexing of data lines equipped with customer-owned equipment.

Most of the cross examination of Rochester Telephone officials has been completed, a PSC spokesman told CW. The next sessions in the hearings are scheduled to begin here July 13.

## USITA Warns Members

### One User Can Force Interconnection Tariff

By Ronald A. Frank

CW Technical News Editor  
WASHINGTON, D.C. — The U.S. Independent Telephone Association (Usita) has told its member companies that just one user asking for interconnection of customer-owned equipment can force a carrier to file a tariff and offer new services.

In a recent handbook on interconnection issued by Usita and sent to member companies, the independents were told they will have to prepare for the interconnection of non-carrier devices on their lines.

To assist Usita members, the handbook lists a set of questions which must be answered by independent phone companies before they can determine a position on interconnection.

In a section on customer relations, the handbook tells the independent carriers that they will now have to compete for the user's business. The handbook advises the phone companies to concentrate on "giving the customer what he wants."

Those companies planning to compete with other suppliers for interconnected users should review their service, the Usita book said. Among problem areas

it advised the independent companies to avoid were: service failures, billing errors, missed service dates, long lead times for given services, slowness to provide new services and lack of "prompt and professional response" by sales, business office and maintenance personnel.

Although AT&T and the Bell System companies have offered interconnection tariffs in most areas of the country, the independent carriers have for the most part not yet formulated interconnection tariffs. Exceptions are General Telephone (GT&E), and Rochester (N.Y.) Telephone Corp., which has recently proposed a simplified tariff for its users.

Most of the smaller independents have interconnected users on special assemblage, or individual agreement, arrangements, thereby avoiding the necessity of filing a general tariff with state regulatory agencies.

The Usita handbook includes a list of connecting arrangements available from independent suppliers. Based on a Usita survey of member companies, the list includes Bell-equivalent connecting arrangements from Elgin Electronics Inc., Watford, Pa.;

Ford Industries Inc., Portland, Ore., and Pulsecom, Alexandria, Va.

## Shared Line Use Planned by RCA

CHERRY HILL, N.J. — RCA Service Co. has become "very interested" in setting up a group of data communications users to share carrier facilities under FCC Tariff 360. Provisions for such a group are expected to be established "in the near future," the company said.

Admitting that such shared use of its facilities would also reduce its own costs, RCA said it would provide potential savings for the other users.

Other efforts to set up similar groups have had little success, according to one industry source. Data users who are interested are often already involved with Telapak service, he said. Until the controversy surrounding sharing under that service has been resolved by the courts or the FCC, users apparently are unwilling to get too deeply committed to other line-sharing plans.

## Bits &amp; Pieces

## Classified Ad Writing

## Simplified by CRT System

LONDON, N.H. — The EDS 5700 Ad Taker Terminal from Hendrix Electronics is used with the earlier EDS 3400 Data Base File System, to provide an interactive classified ad composition system for newspapers. The system enables a clerk to type, and verify, and edit an ad, and receive billing and credit information. In orders of eight or more, the 5700 goes for under \$5,000, while the 3400 controller varies in price from \$59,000 to \$130,000, for interfacing from 11 to 53 terminals respectively. Delivery is 90 days from Greater Airport, here.

Fairchild Expands Keyboard Line PLAINFIELD, N.Y. — Fairchild Camera and Instruments' Graphic Equipment Division has added six models to its ElectroSet line of electronic keyboards. The 450 Editor has a floating display and paper tape reader, to improve speed in making corrections and producing a clean tape.

Other configurations include multiple-code key and programmable multiple-key combinations. Prices range from \$3,965 to \$8,965. Delivery is in 60-90 days, from 221 Fairchild Ave., 11040.

AstroSystems Adds Data Logger LAKE SUCCESS, N.Y. — AstroSystems' AD1000-125 Data Logging system accepts multiple digital and analog inputs from a mix of process transducers and digital devices end, at present intervals, prints or sends to a CPU a three-character reading for each of the inputs, as well as the time in hours and minutes. There is also a three-digit visual readout.

The system, with either a TTY or a computer interface, costs about \$12,000. Delivery is quoted at 120 days. AstroSystems, Inc. is at 6 Nevada Drive, 11040.

Litton Offers Business Computers CARLSTADT, N.J. — Four hard-wired business computers from Litton Industries Automated Business Systems Division cost from \$14,900 to \$17,150.

The ABS 1220-1, 1220-2, 1221-1, and 1221-2 are firm-wire machines, with program logic installed and modified at the factory. Data and variables are under operator control, and can be entered from edge punched cards, paper tape or the keyboard.

Maximum printing speed is 35 char/sec, and top read/punch speed is 50 char/sec. The firm is at 600 Washington Ave., 07022.

## Sanders Has Intelligent Terminal Series

By Michael Merritt

NASHUA, N.H. — Sanders Data Systems has entered the programmable terminal systems fray with the "Can Do" Series 800.

Based on the 800 microprocessor, the system can be designed for stand-alone or clustered terminal use, has communications capabilities, and some data-manipulation and arithmetic software. The system is useful in communications, batch processing, peripheral control and data entry and manipulation applications.

The 800 is a 16-bit instruction word serial processor that operates on 8-bit data. The semiconductor memory is expandable to 4K, 16-bit words, arranged in 16, 256-word pages.

Instruction rate is 165K instruction/sec, about 6  $\mu$ sec/instruction. The instruction set includes 16 operation codes, seven register-to-register instructions, and one each for a family of microinstructions and extended operation instructions.

There is hardware ADD and SUBTRACT, but multiply and divide are software routines.

The microprocessor is included in the skin of the stand-alone 804 CRT terminal, which sells for \$5,380 and rents for \$195/mo. It is also the basis of the separate terminal and communications processors, which sell for \$5,900 and \$4,900 respectively.

In a cluster mode the system is composed of eight 860 terminals which are 804s without the microprocessor, and sell

for \$1,100 and a terminal and communications processor.

There is another CRT terminal, the 802, which has the processing capabilities of the 804 but is not programmable. The 802 sells for \$4,800 and rents for \$150/mo.

Peripherals include a \$2,600 300 cpm/min card reader, including adapter; a \$2,540 dual cassette tape transport with adapter; and three printers, ranging in speed from 30 char/sec to 200 line/min, and in price from \$3,200 to \$9,450 with adapters.

There is a charge for keyboards, as well. There is also a communications line controller that interfaces with 360s and

370s under BTAM, QTAM, TCAM or user-developed access methods. An MICR reader is also available.

An eight-terminal cluster system would cost about \$30,550, or \$385/mo, depending on user needs. By way of contrast, an eight-terminal Four-Phase System IV-90 configuration would cost \$15,340, or \$244/mo, with 6K or ROM of 6K of read-write memory. On the other hand, eight Vision System 21 terminals, each with two tape cassettes and communications adapters, would cost about \$30,000.

First delivery is scheduled for December from D.W. Highway South, 03060.

## Lockheed to Enter 2365 Battle, Underprices IBM, Ampex, Cogor

LOS ANGELES — The least expensive replacement yet for IBM's 2365 core memory box for 360/65s, 67s, 75s and 85s is being built by Lockheed Electronics.

The MM-365 will sell for \$300,000, while IBM's price is around \$390,000. The Ampex 2365 replacement sells for \$308,000, and the Cogor 70 goes for \$210,000.

The Cogor unit, scheduled for delivery in August, is a semiconductor memory, while the IBM, Ampex, and Lockheed devices all use ferrite cores. Ampex ap-

parently has the only replacement unit installed to date.

Lockheed's MM-365 has a 700 msec cycle time and a 350 msec access time, for a memory of 256K — the specs expected for a 2365 replacement. Standard features include a system expander, storage protect, and fetch protect for 65s and 75s.

Options are two- or four-port entry, automatic error correction, and a 370 compatibility conversion feature.

The Lockheed unit "uses half the power, generates half the heat, weighs half as much, and requires one-third the floor space of the IBM system," the company claimed.

A prototype is scheduled for the end of the summer, and first installation for December.

Lease rates will be \$7,900/mo on a one-year lease, \$7,000/mo, on a two-year, and \$6,000/mo on a three-year lease.

Maintenance will be provided by 20 people in eight offices to service users of large 360s clustered in three fairly compact geographical areas, according to the firm. Lockheed is at 6201 E. Randolph St., 90040.

## Logic Offers Key-Entry System

CHERRY HILL, N.J. — Logic Corp.'s LC-700 key-to-disk data entry system is designed for medium-size users who need from nine to 20 input stations.

The 700 central controller includes a Varian mini and interfacing for disk, tape, and printer peripherals.

The disk file is said to hold over 1,000 program formats, which can be modified through an interactive software supervisor included with the 700 system.

The disk has a capacity of either 7.25M 8-bit bytes in a 2311-type configuration or 29M bytes in a 2314-style unit. Access time of the 2311-type is 32 msec. All LC-700 disk packs can be read on IBM or RCA drives, for backup, the firm said.

The tape station offers read-after-write. Tape output is IBM-compatible 7- or 9-track 200 to 1,600 bit/in. Each station has 14 control, 10 numeric, and 27 alphabetic keys along with a non-CRT display panel that signals last character, error, insert, search edit data, verification, and other instruction and control information.

Data entered at each station via 029-

compatible keyboards can be verified immediately through rekeying. Verification can be done later from any key station using editing or selective field keying operations in batch mode.

The central controller rents for \$1,150/mo, and stations are available at \$100/mo, on two-year lease. Delivery time is 90 days, from 21 Olney Ave., 08034.

The full boat with four multiplexed

7816 provides a total of 64 high-speed and 24 low-speed controllers, as well as 128 probes.

ROCKVILLE, Md. — A full-blown Dynaprobe-7800 CPU performance monitor from Comrex can analyze up to 128 systems functions simultaneously.

The complete system which upgrades the earlier Dynaprobe system, includes a D-7817 magnetic tape unit, and four D-7816 Monitor/Tape Buffers, as well as interfacing.

The full boat with four multiplexed 7816 provides a total of 64 high-speed and 24 low-speed controllers, as well as 128 probes.

## Comress Improves Dynaprobe

The D-7800 uses the "Mini-Probe" which weighs less than 1 oz. A real-time clock and external time synchronization are standard features, as is the multi-function register, which permits the read-out of stored data from CPU registers being tested.

The 128-probe system costs about \$50,000, Comrex said. A basic system, including tape drive and monitor/tape buffer, with 24 probes costs \$25,000. Deliveries begin immediately from 2 Research Court, 20850.

## Mixed Marriage Works!

The Data Products LARGE CORE STORE and the IBM 360 Computer have been wed. The 360, formerly exclusively engaged to the IBM 2361, couldn't resist the beauty of Large Core Store with four times faster operation at lower cost.

Another of our dollar liberating ideas.

# Does IBM's price cut add up?

You figure it.

IBM's newly announced cuts in monthly charges for some data processing products might look pretty good.

If you take a fast look.

But can you afford a fast look?

Here's how it all adds up.

An IBM 1403N1 on-line high speed printer will lease for 24 months—with the necessary controller and 3615 feature—for \$1302 per month.

You can rent a comparable Mohawk Data 3160 for \$1050 per month. As the chart shows, our prices are significantly lower across the board. That goes for our other products, too—even in the face of price cuts.

Don't stop adding. There's more. The IBM machine prints 1100 lines per minute, with a 132 character print line. Mohawk's 3160 prints 1250 lpm, with a 160 character print line.

You can vary format more, print more, on fewer forms. It all adds up to more for less.

Now, don't get us wrong.

We think it's pretty nice that the big guys in the industry figure you ought to be paying less for data processing equipment.

We only wonder why they didn't think of it sooner.

Fixed-term lease and maintenance	IBM 1403N1 High Speed Printer* 1100 lpm	MDS 3160 High Speed Printer 1250 lpm	Savings with MDS Printer
12-Month	\$1,426/Mo.	\$1,150/Mo.	\$276/Mo. 19+%
24-Month	\$1,302/Mo.	\$1,050/Mo.	\$252/Mo. 19+%

\*Price includes required 3615 controller and 3615 feature.

Experienced  
Systems Programmers  
A Chance  
to Grow

Go with us - Grow with us. That's the way it is at State Farm. And now that our system 370 model 165 is in operation, we need systems programmers who are looking for challenge and growth.

We have several excellent opportunities for programmers who have IBM 360 experience, who have the necessary COS-MVT qualifications and preferably have experience in using ASP.

We're located in a progressive college town midway between Chicago and St. Louis... an ideal family community... and our employee benefits are top... offering cost of living adjustments and an outstanding retirement plan. So, if you're an experienced systems programmer and your background matches our requirements, we'd like to hear from you. Send your resume to:

This Supplement will examine in depth:  
• The Advantages • Cost Saving Equip-  
• The Problem Areas • Rent and Services  
• Tariff Regulations • Future Growth Trends  
of this explosive submarket.

If your product or service works on a phone  
line, you should be there with your ad.

The environment is right. It's total communications.

The readers are interested. Over 70% indicated high interest in the  
subject of communications in a recent study.

And Computerworld can deliver that sales contract for an average of 36 cents.

You can communicate in Computerworld's Communications Supplement by calling Dorothy Travis at  
(617) 332-5806 or contacting the nearest Computerworld Advertising Sales Office to reserve your space.

Advertising Deadline: 5 p.m. EST, Wednesday, July 14.

# Computer Industry

June 30, 1971

a Computerworld news section about the nation's fastest growing industry

Page 17

## CI Notes

### \$5 Billion Resale Value

NEW YORK — "Ten billion dollars worth of purchased computers are installed and in operation in the U.S. At current market prices, these computers have a resale value of over \$5 billion in the used computer market. Sales in 1970 were \$50 million, only 1% of the potential volume," according to latest "All About Used Computers" study from Frost & Sullivan, Inc.

### Thinking of Europe?

CLEVELAND, Ohio — Charles A. Wilkins, president of International Data Products Inc., 7777 Wall St., will be investigating import/export equipment and software markets in Europe for the next month. Inquiries will be relayed through his office.

### Synoptic Services Delta

PHILADELPHIA — Synoptic Technology, Inc., will act as authorized service agency in the continental U.S. for Delta Data Systems EDP equipment. Specific products serviced by Synoptic will be Delta's Delta 1, TermTerm, BatchTerm, and MultiTerm.

## Supershorts

Western Data Sciences, Inc., Phoenix, Ariz., and Computaria, Inc., of Quincy, Mass., have entered into a joint marketing arrangement by which both firms will promote, sell, and support Ciel II end Proforma packages on independent time-sharing services.

Boeing Computer Services, Inc., will market a family of computer programs by Management Data Systems of Madison, Wis., which provide tenant and management accounting and reporting for local housing authorities.

GSA is accepting proposals for a system that must be at least 16 times faster than a 360/91 on a large benchmark problem. The National Oceanic and Atmospheric Administration's geophysical fluid dynamics laboratory, Forrestal campus, Princeton University will use the system.

Bank holding companies would be permitted to process banking, financial or related economic data for any type of customer, according to an amendment, effective July 1, to the bank holding company act. The amendment is subject to approval by the Board of Governors of the Federal Reserve System.

Data Motivation Inc. has entered into a consulting agreement with NCR to assist NCR Industrial Products Division, Dayton, Ohio, in market planning and product studies relative to the OEM segment of the industry.

## Software Firms Fight GSA Licensing Clause

By E. Drake Lundell Jr.  
CW Computer Industry Editor  
WASHINGTON, D.C. — Software houses are presently locking horns with the General Services Administration over a clause in the Federal Supply Schedule contract that would give the government free license to software packages after an equivalent of 120 months cumulative rental.

The clause calls for a "complete surrender" of proprietary rights held by the software houses, according to several industry sources.

The contested phrasing in GSA ADP Procurement Division Solicitation No. FTFC-2K159-N-1-1571, Dec. 15, 1970, is the basis for the negotiation of Federal Supply Service contracts for the 1972 fiscal year, beginning July 1.

Several of the large software houses contacted by CW said they had negotiated FSS contracts, but that they had not accepted the clause.

### "Somewhat Naive"

"It is somewhat naive" of the government to expect software

companies to sign a contract with such a clause, according to Fred Iker, president of Comrens. In addition, Iker charged that the inclusion of the phrase in the proposed contract indicated a "lack of understanding of the software business" on the part of government negotiators.

Applied Data Research also refused to go along with the clause and the government removed it before the firm signed the FSS pact for this year, according to Martin Goetz, a vice-president at ADR.

Herb Bright, president of another firm which refused to sign the contract with that clause, Computation Planning Inc., said a software company "can't negotiate the surrender of its proprietary rights."

Under the proposed contract, he pointed out, the government would get the program free if it was used by three agencies for 40 months or by 120 agencies for one month.

Other industry sources said the clause, as written, could force a "contingent liability" on some firms. Those that have had packages installed for over the 120 total might be forced to repay the government for the rental paid past the 120 month period, they said.

Officials at GSA refused to disclose how many of the contracts presently in force had included the clause, but industry sources said that around two of the present nine contracts included the wording.

Software industry sources said such "surrendering" was contrary to the basic elements of free enterprise and that such a move on the part of the government could "destroy the retail pricing concept (for software products)."

The action is presently being discussed by members of the Association of Independent Software Companies, but no agreement has been reached yet on a united plan of action.

## DP Makers May Get Relief From Japan Trade Barriers

CW Washington Bureau  
WASHINGTON, D.C. — Computer manufacturers could soon get relief from trade barriers imposed against U.S. goods by Japan, according to a joint communique released at the end of the eighth Japan-U.S. businessmen's conference. The meeting was cosponsored by the Japanese Federation of Economic Organizations (Keidanren) and the U.S. Chamber of Commerce.

"The Japanese delegation pointed out that Japan is moving quickly to remove its import restrictions and stated that it is committed to assuring that Japan also removes its non-tariff trade barriers," the statement indicated.

"Non-tariff trade barriers must be dealt with through multilateral negotiations under the aegis of such instruments as Gatt (General Agreement on Trade and Tariffs)."

The rate of unemployment in this country, aggravated by import competition, is resulting in "strong pressures to protect... industries" such as electronics, the U.S. delegation said.

In a related move, State Department officials told CW the U.S. "would like to see the quantitative [quota] restrictions on computers removed entirely," by the Japanese government. State Department officials also indicated that the removal of barriers against the import of computer equipment into Japan could possibly be taken up by the Gatt organization.

No major computer manufacturer was represented among the 60 U.S. delegates to the recent conference.

From the standpoint of the U.S. delegation, the key purpose of the conference was to impress upon the Japanese the American view that it is in Japan's national interest to:

- "Reduce and ultimately eliminate artificial barriers which Japan imposes against U.S. and other foreign goods and services, thus achieving more reciprocal trading arrangements between Japan and the U.S.
- "Liberalize more sub-

stantially and rapidly Japanese restrictions which inhibit U.S. investment in Japan so that reciprocity of U.S. and Japanese investment policies can be achieved.

## Reserve Board Encourages Member Banks To Move Toward Checkless Society

CW Washington Bureau  
WASHINGTON, D.C.—A move toward making the cashless, checkless society a reality took a giant step forward with a recently policy statement issued by the Board of Governors of the Federal Reserve System. The statement entailed heavy emphasis on the use of computers. The board called for basic changes in the nation's system of handling money payments, essentially transitional steps toward replacing the use of checks with electronic transfer of funds.

Plans call for establishment of new regional clearing centers throughout the country to expedite the clearing process and encouragement of banks and their customers to make greater use of the expanded capabilities of the Federal Reserve System's communications network.

Inducements to begin replacement of check transfers with transfers via wire would include:  
• Removing charges and other restrictions upon the use of the Fed's wire network by member banks for transfers of \$1,000 or more for their customers.

• Increasing the number of hours the network is open for business daily.

• Expanding facilities at reserve offices to equip 1825-560 high-speed tape transmission and computer communications.

This would permit linkups, chiefly of commercial bank computers through the use of Fed-

eral Reserve facilities, allowing virtually instantaneous payment. There would be no charge for the wire service between member commercial banks.

Directed to the presidents of 12 Federal Reserve Banks, the paper said modernization of the country's means of making financial transactions through the banking system "is becoming a matter of urgency."

The board's sense of urgency was based upon estimates that check volume will at least double in the present decade.

An average check passing through the clearing process is handled 10 times under present procedures. Despite the progress in mechanization and automation, according to the board, increases in productivity are limited by the fact that the processing of checks continues to require a substantial amount of hand labor.

**WHAT'S AHEAD** for the computer industry in the 1970's, as the recession draws to an end?

**HOW WILL** the main-frame builders fare? The independent peripheral makers? The crowded service and software industry?

**THE PROSPECTS** are outlined in the "Gray Sheet's" Annual Review & Forecast Issue... covering all industry segments. Send \$10 for the issue, or \$75 for a 24-issue subscription including the annual review.

## Morgan Upgrades Sales Forecast

CW Washington Bureau

WASHINGTON, D.C. — Morgan Information Systems planned to sell 200 units of its Morgan 200 "almost real-time" Autosearch microfilm retrieval system this year. However, Louis P. Rinehart, vice-president of marketing for the company, recently predicted the firm may sell five times its original goal.

The system features update, fast retrieval, computer interface and use with all types of film. Autosearch, the company said, meets the retrieval needs for the "after computer-output-microfilm (COM)" users for equipment which combines both computer and microfilm technologies.

The 200 uses roll microfilm which can store and retrieve up to 100,000 pages of computer printout on a roll of 105 mm film.

The Autosearch terminal enables the user to update his information by use of a second roll of 16 mm microfilm which carries revised and new data. When incorporated into the system's file, the information is coded with a location number identical to the page it replaces.

Marketing of the 200 is being handled initially through COM service bureaus. "They're doing business with the people we want to contact," explained Rinehart. "With limited capital we can't mount a major marketing program on our own."

Morgan will also "OEM" its product through a major company, Rinehart disclosed, and maintenance is being handled nationwide through Anderson Jacobson, the acoustic coupler firm. The 200 sells in the range of \$5,000 to \$8,000 and Morgan is currently negotiating with two companies to handle third-party leasing arrangements for the equipment.

## Orders and Installations

A large department store chain in Germany, Kaufhof A.G., headquartered in Cologne, has ordered an Input 80 optical character recognition system from Recognition Equipment GmbH.

Forismouth (Va.) General Hospital has installed an IBM System 3/6 in its pathology department.

An EMR 6135, valued at about \$240,000, has been ordered by Executive Data Systems, Cedar Rapids, Iowa, for use in its hospital information network.

Bell Telephone Co. of Canada has ordered a Honeywell Model 6030, valued at \$1.6 million, for use in the company's research, engineering, financial and DP departments on a time-sharing basis.

Maryland Casualty Co. of Baltimore will use its IBM 370/155 to expand Telfast, a policy writing service.

The First Federal Savings and Loan Association, Fort Lauderdale, Fla., has ordered an NCR Century 300.

NCR Century 50s have been installed at: Water Bonnet, Inc., Orlando, Fla.; The First Federal Savings and Loan Association, Savannah, Ga.; Pepsi-Cola Bottling Co. of Central Virginia, Charlottesville; and High Grade Beverage of New Brunswick in New Jersey.

Tempo Computers, Fullerton, Calif., has installed a Tempo I at the Jet Propulsion Laboratory of the California Institute of Technology for use in an evaluation system for simulation experiments on a deep space probe that will be sent to Mars.

Allengrey Power Service Corp. has ordered two General Electric GE-Pac 3010 process computers to be used for a supervisory control and data acquisition system in West Virginia by the Monongahela Power Co.

A second Univac 494, valued at about \$2.1 million, has been acquired by the Yasuda Banking and Trust Co. of Tokyo, Japan.

## POSITION: MANUFACTURING SYSTEMS ENGINEER

**SALARY: \$18,000 to \$28,000**

**EDUCATION:** Degree in Industrial or Mechanical Engineering and knowledge of computers.

### POSITION PROFILE:

Must have extensive experience in developing computerized systems for manufacturing information flow and control which will include inventory and production control, production planning and control, scheduling, budgeting, etc. for various levels of production and marketing forecasts.

Also, 5-10 years experience needed in line management or supervision in the manufacture of electro-mechanical products. Position requires high degree of tact and persuasive ability in promoting applications of recommended products.

It is anticipated that development of this system will take two to three years. The reason for requiring line management or supervision in the manufacture of electro-mechanical products is that the company intends to transfer the successful candidate into a comparable or higher paying position when this product has been completed.

We have a continuous need for Data Processing Managers, Systems Analysts, and Programmers. If you are interested in investigating the possibility of improving your Career Development, send your resume and salary history to: Paul Christiansen.

If power problems are  
making you mad enough  
to see "BROWN"—

## YOU NEED... POWERGUARD B

POWERGUARD B is a very low-cost power analysis system designed specifically for people who are plagued with "brownouts." It has adjustable set points for both low and high voltage levels. You merely move the front panel slides to the desired voltage limit alarm points. The unit includes a bell alarm to notify you their power is outside of the set point limits. A digital clock displays the time of the out-of-tolerance condition and a light indicates which limit is out of tolerance. Installation is as easy as plugging PowerGuard into a convenient outlet.

\*Single phase units (110-120 volts) can be purchased for only \$356.00.

\*Three phase units (208-240 volts) can be purchased for only \$785.00.

More sophisticated  
POWERGUARD  
models, as well as  
environmental  
monitoring equipment,  
may be purchased  
or leased.

## Nicks & Dimes

Barry Wright has reached agreement with State Street Bank of Boston for a \$5 million revolving three-year loan, replacing a \$4 million revolving loan in effect the past three years. The amount currently outstanding is \$1.3 million.

\$\$\$

American Data Systems is in the final stages of completing about \$3 million in refinancing. ADS also expects to increase its bank's line of credit to \$3 million, subject to certain provisions.

\$\$\$

"Delays associated with production start-up of new products and systems" prohibited higher shipment levels, said Interdata President

Daniel Sinnott. In the first quarter the minimizer dipped sharply in the red, with a loss of \$218,500 on revenues of \$1.4 million. The revenue was about the same for last year's period, when Interdata netted \$40,400.

\$\$\$

Diebold Computer Leasing has agreed to a request from holders of about 1.5 million shares (including shares issuable upon conversion of outstanding 6% convertible subordinated notes) to register the shares.

\$\$\$

DCS Computer Services earnings doubled in the half year. Sales totaled \$723,595 and earnings \$30,215 or 6 cents a share. This compares with sales of \$347,374 and earnings of \$14,360 or 3 cents a share during the first half last year. In the second quarter, sales were \$374,893 and earnings \$16,065 or 3 cents a share compared with \$203,872 and \$4,096 or 1 cent a share for the three months last year.

## Sanders Reveals Tight Money Situation

By a CW staff writer

NASHUA, N.H. — Sanders Associates, Inc. may not have "adequate working capital to meet future operational requirements" if a "timely and satisfactory" agreement is not reached on its contract with the Air Force for countermeasure equipment on the F-111 airplane.

Another major cause for difficulties is in the Data Systems Division, the firm's nine-month report shows.

The revelation of the tight working capital situation came as Sanders reported a loss of \$622,000 or 10 cents a share for the nine months ended May 2. In the same period a year ago, the firm earned \$455,000 or 10 cents a share.

The nine-month loss reflects a special charge of \$2 million before taxes to provide a reserve for the division against possible write-downs on its products, according to Royden C. Sanders Jr., president.

The action was taken in the third quarter of the present fiscal year, Sanders said, pending a final evaluation of the impact on the company's commercial products lines of recent industry price changes and a general de-

cline in computer industry sales.

The evaluation of the impact of price changes on the Data Systems Division products will be completed during the fourth quarter of the present fiscal year and "additional adjustments that may be required, if any, will be reflected in the results for the fiscal year ending July 31," the firm said.

Net earnings before provision for the special charge were \$427,000 for the third quarter

and \$417,000 for the nine-month period, or one cent and nine cents a share respectively.

The Sanders contract with General Dynamics Corp. for the electronic countermeasure equipment is reportedly about \$88 million, but its expenses on the program are reported to be "significantly" more.

Revenues as well as earnings fell in the nine month period, from \$124.6 million a year ago to \$116 million this year.

## Collins Compiles 3d Quarter Loss

DALLAS — Collins Radio Co., which will soon be receiving a fiscal shift in the arm from North American Rockwell (NAR), has reported a third quarter net loss of \$5.7 million, or 91 cents a share, on sales of \$64.9 million.

This brings Collins' total losses for the nine months to \$57.7 million, or \$1.92 a share, on sales of \$211.7 million.

The quarter's sales dropped dramatically from \$80.6 million a year ago, when Collins made \$168,000, or five cents a share. The company blamed the sales drop on reduced procurement and rescheduling of deliveries in government and avionics systems.

Collins for a long time has resisted acquisition by other firms, but recently signed an agreement with NAR to sell it \$35 million of a new class of preferred stock. While the agree-

ment has been signed by heads of the two companies, it is not yet final.

### Computer Institutes Settle Antitrust Suit

NEW YORK — Electronic Computer Programming Institute and Herring Institutes, Inc. have settled the litigation with which they were involved.

Herring, headquartered in Milwaukee, Wis., owned and operated eight franchised ECPI computer schools in the Midwest and Canada. In June, 1970 ECPI demanded that Herring refrain from taking certain actions which ECPI deemed to be in violation of its franchise agreements. Herring countered with an antitrust suit and ECPI counter-claimed to collect monies due and for breach of contract.

Under the settlement, Herring is to pay ECPI \$250,000.

## 60% of Package for Sale

## 'What Are We Bidding On?' Stops Software Auction

By Don Levitt  
City Staff Writer

CAMBRIDGE, Mass. — Have you ever been to a software auction? An auction in which the merchandise is described as an "approximately 60% completed" real-time, on-line shareholder accounting package, together with "partially completed documentation"? It's a strange experience.

The program was begun by Commonwealth Computing, Inc. (CCI), and was being sold by Asset Management, which had a lien on the program to cover a CCI debt.

Calls by prospective bidders to Asset apparently went unanswered during the week before the sale so attendees had no

clear idea of what was being sold.

Arriving when the auction was supposed to start, one attendee was told that the documentation was in the next room. But he then was asked, as an afterthought, "Are you the auctioneer?"

The documentation showed that the system was being developed in Cobol to run in a 65K partition under DOS/360, and to handle mutual fund shareholder accounting in either batch or on-line mode. Nothing was available to indicate whether any portions of the system were "up and running."

Before the bidding began, an Asset spokesman filled in some details. He was pretty sure that

whatever coding had been done was in the office on punched cards. The update section of the system was complete, he said, but he wasn't sure if "complete" included programming.

The chief architect of the system couldn't answer any questions, since he was in Philadelphia.

And then arose the question of what the winning bidder would actually get. Asset Management was the "secured party" in the Commonwealth debt, and the program was the security.

While Asset and the auctioneer assured the bidders they would be assigned whatever rights Asset had in the program, they couldn't quite say the win-

ner would actually receive full title. And so the auction got underway. As other bidders wondered whether they were being asked to "buy the size instead of the steak," Asset itself entered a bid for \$20,000.

Commenting that nothing about the system disclosed thus far warranted such a high bid, another member of the audience asked if the Asset bidder had

additional information not available to the general public. The Asset bidder answered that \$20,000 was the amount he was instructed to bid, and claimed to win.

The auctioneer, fearing legal complications, promptly postponed the affair for a week. During that time, he said, Asset should make a real effort to define what was actually being sold.

## Nader Asks DPsers for Aid

(Continued From Page 1)

sumers really want" must be answered. One non-DP member of the community worker here

of the audience, Mildred Claypool, a book issue with Nader, Kuch and others.

She said Nader was talking about using volunteers to gather the input data, and Kuch about the amount of money it would cost for a consumer to be on-line to a system.

"You may send volunteers" into the ghetto, she told Nader, "but we ain't going to give you volunteers. Our people want money for their volunteer work. They need to eat."

"If I had \$1, I'd rather spend it on food rather than spend it fooling around with a computer," she remarked to Kuch.

What is needed "is not a national consumer data bank but a study comparing urban and suburban areas. Consumer problems in the suburbs and in the ghettos are different," noted Donald P. Rothchild, a professor of law at the National Law Center, George Washington University.

Dr. Carl Hammer, director of computer sciences, Univac Federal Systems Division, put a damper on a consumer information system, indicating its costs would be astronomical.

Funding of such a system was also discussed. Malcolm D. Smith, staff advisor in marketing for Honeywell Information Systems, suggested that a non-profit corporation, similar to Comsat, might be the answer, since a great deal of money will be necessary to operate a project of this magnitude.

## Maintenance Charges Rearranged by IBM

(Continued From Page 1)

On System 370 electronic equipment the 12-hour rate is unchanged, and the 24-hour rate is reduced from 20% to 18%.

Lowered were the 16- and 20-hour premiums. Of interest to large teleprocessing system users, IBM is now offering centralized maintenance control at no extra cost. Maintenance at remote sites will be directed through one site, presumably located at or near the central computer of the network.

The new service will track the performance of the teleprocessing system and identify areas needing upkeep.

IBM has also altered the hourly machine rates, for Business System Centers, Datacenters, and Sensor-based Systems Centers. At these centers IBM's Data Processing Division makes equipment available for use by customers' operators. The service is used to meet peak loads and other one-shot situations.

Rates on 14 machine models will be reduced effective July 1, and charges will be increased on 116 models Oct. 1.

Rates were increased an average of 11% on equipment that includes all 360 CPUs, and the 370/155, 231/4 disks and 2401 series tape drives. Two models of the 1403 printer were increased and two decreased.

## Small things are happening at JTC.

JTC... the first independent company in the East to offer new System/3 Mini-cards. With all the extras you expect from JTC. Aging in scientifically-controlled areas to minimize the effects of humidity changes. The most stringent control standards in the industry. Handy identify boxes. The right price — with no order charge... 48-hour delivery throughout New York, New Jersey, Connecticut and the surrounding area — in our own fleet of trucks.

## Big and colorful things are happening too.

There's another new card in JTC's deck. Provides high-speed, high-quality two color printing on one side of your card... another color on the reverse side. Adds new flexibility to your system. Use it for proxies... dividend notices... bills... order and re-order cards... warranties... special promotions. Everything that requires one side for a message and the second side for a return address, name and address, or other material.

JTC has all the cards. Plus a complete line of other computer supplies and services. A full house. Where things are always happening. Small things. Big things. Things to make you glad you're doing business with JTC.
